Next Generation Hydrologic Models: Breakout Report

Levi Brekke, Lynn Johnson, Pedro Restrepo
NOAA Water Cycle Science Challenges Workshop
September 1st, 2011
Presentation Outline

- Framing questions/suggestions
- Potential Modeling System Goal
- Potential Modeling System Requirements
- Possible Attributes of Next Gen Models
Framing questions/suggestions

- Hydrologic prediction service demands vary by scale
- Human dimensions.
- Importance of Education/Training to support Model deployment
- NOAA Cooperative Institutes focused on Hydrology
- Quantification of Uncertainty
Potential Modeling System Goals

• Develop models that require little or no calibration

• Apply system to develop hydrologic scenarios.

• Model structure that supports multiple process hypotheses & process interactions

• Simulation of water, energy and mass (nutrient) balances

• Support high spatial-resolution forecasting (~1km res)

• Calibration issues
Potential Modeling System Requirements

• Intelligent Grids
• Use of existing observations and anticipate new developments
• Simulation of Water Management Actions
• Scope of processes
• Simulate energy budget, not just water budget
• Support prediction on short to long time scales, from highest to lowest flows
• Forecast other variables in addition to streamflow
Possible Attributes of Next Gen Models

- Linked/nested system of models
- Single unified/community model?
- Multiple model calibrations, targeting to different operational forecasting purposes?
- Geography
- Address processes not well-represented in current services
Data requirements to support Next Gen Models

- Pursue field campaigns
- Reach out to other disciplines
- Soil moisture and groundwater monitoring
- Real-time verification information
- Radiation components
- Water Management actions
- Data Integration
- Hydrologic data standards
• Questions, additions, subtractions?
